ABOUT ME

I'm a developer who loves creating things on the web. Whether it's a full-stack app, a clean UI, or a new feature, I enjoy the process of building and problem-solving. I'm always learning, experimenting, and pushing myself to do better. I want to work on meaningful projects and grow into a well-rounded, reliable engineer.

EDUCATION

Bachelor in Science (IT) FY

St. Andrew's College 2025-2027 (ongoing)

PROJECTS

LandBnB

landbnb-hq85.onrender.com

- Developed a **full-stack** property rental platform inspired by Airbnb, built using **Node.js**, **Express**, **MongoDB**, and **EJS**. Implemented secure user authentication with **Passport.js**, session handling using **Express-Session + MongoDB store**, and role-safe **CRUD** operations for property listings. Integrated **Cloudinary** for optimized media uploads, **Multer** for file handling, and **Joi** for backend validation. Added **geocoding** through **Nominatim** and interactive maps using **Leaflet.js**, enabling location-based search and visualization. Designed with a clean **MVC architecture**, responsive UI (Bootstrap + custom JS), and a scalable **RESTful** structure suitable for production-level listing applications.

Khana – Recipe Finder

khana-recipe-finder.vercel.app

- Built a modern, responsive recipe discovery platform powered by **React**, featuring real-time search and dynamic recipe rendering via the **Forkify API**. Structured with modular components, global state management using the **Context API**, and persistent user preferences (favorites, theme mode) stored in LocalStorage. Implemented seamless navigation through **React Router**, custom hooks for toast notifications, and smooth page transitions for a polished UX. Styled entirely with **TailwindCSS** for fast, consistent UI development, creating a lightweight and extensible frontend application ideal for food discovery use cases.

Role-Based Task Dashboard

- Utilizing **React**, **Vite**, and **TailwindCSS**, enabling administrators to create, assign, and monitor tasks while employees can track progress across multiple states (New, Active, Completed, Failed). Implemented global authentication and access control logic via the **Context API**, with all application data persisted in LocalStorage for a fully frontend, serverless workflow. Designed reusable UI components, real-time task updates, and a clean, modular structure that serves as a foundation for scalable productivity or team-management tools.

SKILLS

- | | | |
|--------------|---------------|---------|
| • MERN Stack | • TailwindCSS | • MySQL |
| • JavaScript | • REST APIs | • Git |
